

Depression Owen Sound

Depression Owen Sound - Depression is a physical condition where a low mood could have an effect on the thoughts, behaviour, physical well being and feelings of a person. Depression could lead to aversions to activities which one would normally enjoy, as well as feelings of sadness, hopelessness, emptiness, anxiety, guilt, restlessness, and irritability.

People who are suffering from depression can have trouble making decisions, remembering details or concentrating. Suffering these cognitive impairments can make situations more difficult to deal with sometimes. Sadly, several extremely depressed individuals can think about or even attempt suicide. Various indications can include insomnia or excessive sleeping, dramatic weight change, either gain or loss, digestive problems, fatigue, pains, aches, changes in sleep pattern and loss of energy.

It is common for people to experience a depressed mood as a reaction to specific life events and also as a sign to several medical conditions comprising hypothyroidism and Addison's disease. Depression is even a feature of various psychiatric syndromes. There are several sicknesses that feature depression.

Psychiatric Syndromes

Mood disorders come from the category of disorders that are caused mainly by the disturbance of moods. Within this particular category, major depression or major depressive disorder, commonly known as MDD for short, also referred to as clinical depression, is when at least 2 someone experiences 2 weeks of a depressed mood or loss of interest or loss of pleasure in almost all daily activities.

Those individuals who are coping with bipolar disorder might go through episodes of major depression. The state of chronic depressed mood is called Dysthymia. In Dysthymia, the indications do not meet the severity of a major depressive episode. Borderline personality disorder is one more condition which is outside the mood disorders but where a chronic depressed mood is also a common feature. There are several psychiatric syndromes which feature depressed mood as the main indication. Adjustment disorder with depressed mood is another mood disturbance that appears as a psychological reaction to an identifiable stressor or event. In this particular case, the resulting emotional behavioural indications are significant, although they do not meet the criteria for a major depressive episode.

Non-Psychiatric Illnesses

There are various reasons depressed mood could present in a person. It can be the result of numerous infectious diseases or physiological issues. Glandular fever or Mononucleosis is an example that can be caused by two separate viral infections. This particular condition often results in indications which mimic a depressive psychiatric disorder. usually, the depression is one of the initial signs of hypothyroidism too, which is reduced activity of the thyroid. Numerous individuals coping with chronic and debilitating diseases or individuals who are on daily medications suffer from depressed mood also.

Life Events

Life events could initiate depression in several individuals. This can cause a dangerous feedback loop, since re-living the events and remembering the feelings can cause further depression. This can hinder the ability of the patient to take initiative and solve problems. Psychology is often a positive option for people who are suffering from depression caused by life events.

Neurotransmitters

Scientifically speaking, depression is attributed to changes within the neurotransmitters found within the brain which help the cells communicate. These substances are referred to as nor epinephrine, dopamine and serotonin. Several things can influence these neurotransmitters including: genetics, physical sicknesses, diet, hormonal changes, personality, aging, substance abuse, social circumstances, light and seasonal cycle changes, and medications.

Assessment

So as to complete an assessment, usually a medical doctor would record the patient's medical history, complete a full physical assessment and carefully evaluate the signs so as to establish the cause of the depression. Certain standardized questionnaires comprising the Hamilton rating Scale for Depression and the beck Depression Inventory can be used.

So as to cancel out whichever other symptoms or causes, the medical doctor will typically perform a medical exam and other investigations. Tests may include blood tests, that will measure the TSH levels and thyroxin so as to exclude hypothyroidism. Serum calcium and basic electrolytes are measured to insure there is no metabolic disturbance. A full blood count including ESR is taken to be able to check for systemic infections or chronic disease. It is essential to also rule out adverse reactions to whichever alcohol misuse or medications. Testosterone levels could likewise be evaluated in order to check hypogonadism that is a condition known to cause depression in males.

To be able to help distinguish depression from dementia, cognitive brain testing together with brain imaging is accessible. Subjective cognitive complaints may be able to indicate the start of a dementia disorder like for example Alzheimer's disease. A CT scan can even be taken in order to exclude brain pathology in people with psychotic, rapid-onset or otherwise unusual symptoms.

Treatment

Treatment varies from patient to patient and depends on the cause of the depression. There are a lot of likely solutions accessible. Sometimes it is difficult for the psychologists, psychiatrists and doctors to know which one is best recommended. It is essential that depressed individuals get the help they need, either through counseling, mediation or cognitive behavioural therapy in order to live their lives to their fullest potential.
